How to Use the *DEA 72-Hour Emergency Rule* for Methadone and Buprenorphine in Jails

HMA ISSUE BRIEF

MARCH 2021

Patients may enter your facility on methadone or buprenorphine for treatment of Opioid Use Disorder. This brief explains how jail physicians can use the DEA "72-Hour Emergency Rule" to continue these essential medications without interruption while the jail establishes a longer term plan for continuation. This is essential to maintain sobriety and prevent relapse, overdose, and death.

When a person is booked into a jail and reports active treatment for Opioid Use Disorder (OUD) with methadone or buprenorphine, jails may face challenges in timely access to the medications. Confirming methadone treatment at the patient's Narcotic Treatment Program (NTP) or buprenorphine treatment with the community provider or NTP can take several days, especially if jail intake occurs over a weekend or holiday. The U.S. Drug Enforcement Agency (DEA) provides physicians with emergency access to these medications for up to 72 hours in such cases to enable detainees to receive the medications without interruption while the jail establishes a longer-term plan for the remainder of incarceration. This Issue Brief provides important information on HOW jails can access methadone under the DEA's "72-Hour Rule." Comments related to accessing buprenorphine under the 72-Hour Rule are included at the end.

WHY CONTINUE METHADONE DURING INCARCERATION?

Detainees who enter jails on methadone for treatment for OUD will begin to experience opioid withdrawal just 24 – 48 hours after the last dose of methadone. The withdrawal will worsen and typically peak at seven days and can last more than 21 days. During withdrawal, opioid cravings driven by dopamine depletion are extremely strong and the physical effects of withdrawal are torturous. SAMHSA's Treatment Improvement Protocol 63 *Medications for Opioid Use Disorder for Healthcare and Addiction Professionals, Policymakers, Patients, and Families,* updated in 2020, provides detailed evidence on the clinical importance of maintaining methadone treatment.

Detainees in methadone withdrawal are at extreme high risk for relapse either by obtaining opioids in the jail or using immediately upon release. Many jail releases are unplanned and precipitous, so maintaining detainees on methadone treatment immediately and continually is imperative to preventing relapse, overdose, and death during and following incarceration. Various studies have demonstrated that in the first four weeks following jail release the risk of

overdose is anywhere from 13 to more than 100 times greater than the risk for the general population. [1,2]

In addition, detainees who are maintained on methadone during incarceration are more than 400% more likely to return to their community methadone providers after release than those who are forcibly withdrawn or tapered from methadone.[3]

Finally, OUD is a condition protected by the Americans With Disabilities Act for which there is evidence-based treatment. Providers who willingly terminate such treatment deviate from the standard of care. This creates the risk of deadly outcomes for patients and creates legal risk for the provider and the jail.

Rapid access to methadone is essential to sustain recovery from OUD during incarceration. The DEA's "72-Hhour Emergency Rule" was created specifically for this circumstance.

METHADONE TREATMENT FOR OUD

Methadone is a Schedule II Controlled Substance. Physicians with DEA registration may prescribe methadone to treat pain. Nurse Practitioner and Physician Assistant authority to prescribe methadone to treat pain varies by state.

Treatment of OUD with methadone, however, may only take place through a licensed Narcotic Treatment Program as specified in CFR Title 21 §1306.07 Administering or dispensing of narcotic drugs:

> (a) A practitioner may administer or dispense directly (but not prescribe) a narcotic drug listed in any schedule to a narcotic dependent person for the purpose of maintenance or detoxification treatment if the practitioner meets both of the following conditions:
>
> (1) The practitioner is separately registered with DEA as a narcotic treatment program.
>
> (2) The practitioner is in compliance with DEA regulations regarding treatment qualifications, security, records, and unsupervised use of the drugs pursuant to the Act.

Note the terms "administer" and "dispense." Federal law expressly prohibits the "prescription" of methadone (or any scheduled drug) for the treatment of OUD.

Many treatment requirements are imposed on NTPs including daily in-person methadone administration until stability is documented and sustained, take-home dosing at prescribed

intervals for stable patients, random periodic urine drug screens, mandatory counselling, and more.

"THE 72-HOUR EMERGENCY RULE"

CFR Title 21 §1306.07 (b) sets forth the conditions for *emergency administration of methadone outside of an NTP*, known as the 72-Hour Emergency Rule or the Three Day Rule:

> (b) Nothing in this section shall prohibit a physician who is not specifically registered to conduct a narcotic treatment program from administering (but not prescribing) narcotic drugs to a person for the purpose of relieving acute withdrawal symptoms when necessary while arrangements are being made for referral for treatment. Not more than one day's medication may be administered to the person or for the person's use at one time. Such emergency treatment may be carried out for not more than three days and may not be renewed or extended.

Of note:

- Only **physicians** may use this provision; midlevel providers are excluded
- One dose per day is allowed and for not more than three days
- The emergency period cannot be renewed or extended during the withdrawal period (but the provision applies separately to each instance of incarceration)
- No more than one day's medication may be administered or given to a patient at one time
- Legislative efforts to ease these requirements were unsuccessful in 2020 but may be revisited in the future.

USING THE 72-HOUR EMERGENCY RULE IN A JAIL

Accessing Stock Methadone

Because methadone cannot be *prescribed* for treating OUD, patient-specific doses are prohibited when using the 72-Hour Emergency Rule. Instead, a jail physician must have access to *stock* methadone under one of the following options:

1. If the jail has a licensed pharmacy on site, the pharmacy can stock methadone and manage the inventory, expiration dates, wastage, etc. State pharmacy board requirements apply.
2. If the jail does not have a licensed pharmacy but has a relationship with a pharmaceutical vendor, the vendor may be able to provide stock methadone. State pharmacy board requirements apply.
3. If the jail has a relationship with a pharmacy that is not on site, that pharmacy can provide methadone in an emergency box owned by a pharmacy and transferred to the facility under the pharmacy's license. This option is widely used in nursing facilities and rarely in jails.
4. A "physician office" can be established in the jail under the physician's license for dispensing/ administering methadone under that license. This is the most common scenario seen in jails across the country and it comports with the DEA rules for 72-hour

emergency use of methadone and buprenorphine. The methadone is obtained from a local retail or hospital pharmacy using a DEA Form 222. State pharmacy board requirements may also apply to this option.

USING DEA FORM 222 TO PROCURE METHADONE

Obtain Form 222

Physicians who are registered with the DEA may obtain Form 222 from the DEA. It serves as a "prescription pad for Schedule I or II Controlled Substances." Until October 2019, DEA issued triplicate 222 Forms. In October 2019 a two-year transition to the DEA's new single sheet form began. Physicians who currently possess triplicate forms may use them through September 2021. The physician's unique DEA registration number is required. DEA 222 forms must be kept for two years.

DEA Form 222 can be ordered online by the physician registrant at

https://apps.deadiversion.usdoj.gov/webforms2/spring/orderFormsLogin?execution=e1s1

Plan with local pharmacy

If the jail has never obtained methadone from a pharmacy, the physician or health services administrator should confer with the pharmacy to discuss the jail's intent and the pharmacy's processes. Most pharmacists should be familiar with the DEA Form 222 though they may wish to confer with the state Pharmacy Board. Also, local pharmacies may not have methadone in house and may need time to procure a supply. Because the need for methadone will be very time sensitive, this conversation and an initial stock order should take place *before* a case presents.

Decide on quantity

Stock quantities should be sufficient to address emergent needs at the jail for 30 – 60 days. DEA may consider frequent Form 222 requests as evidence that the process supports treatment beyond emergent use. The jail should also confer with the pharmacy about shelf life/expiration dates in determining stock quantities.

Safeguarding Methadone at the Jail

Stock methadone must be safeguarded as any other controlled substance inside a jail. In accordance with DEA and state rules and regulations for safeguarding controlled substances, they must be stored properly including being logged into the medication area by two parties, double-signed, and stored in a separate locked device. Patient-specific data is recorded for each dose administered, and count is verified and double-signed by nursing or pharmacy techs at the end of each shift.

Wasting methadone for any reason must be witnessed and documented as with other controlled substances.

Administering Methadone

The physician acting under the 72 Hour Emergency Rule may delegate the administration of the methadone to nursing staff with proper documentation. The nurse should document the dosage in the Medication Administration Record.

ARRANGEMENTS WITH NTP FOR METHADONE THROUGHOUT INCARCERATION

During the 72-hour emergency period, the jail must make arrangements with the patient's NTP to provide the methadone during the remainder of incarceration. This is usually done through take-home dosing. There are many options for take home dosing and payment for methadone during incarceration, and these topics are beyond the scope of this document. Note the following:

- The DEA expects NTPs to make meaningful efforts to serve incarcerated patients but does not provide rules or guidance as to how this may occur
- State NTP licensing rules address take home dosing and expectations of NTPs to serve their clients during incarceration
- Tapering methadone during incarceration is not evidence-based care and places the patient at extreme risk for relapse, overdose, and death
- One NTP may provide methadone to a patient of another NTP under "courtesy dosing" rules. For jails in communities with more than one NTP, this allows a contract with a single NTP that can serve any incarcerated methadone patient.

THE 72-HOUR EMERGENCY RULE AND BUPRENORPHINE

The provisions of CFR Title 21 §1306.07 (b) apply to continuation of buprenorphine as well. The provider must be a physician and need not be X-waivered. As a Schedule III drug, the use of DEA Form 222 is not required to obtain buprenorphine. However, under this provision the buprenorphine may not be "prescribed," and the jail must have access to stock buprenorphine. The same four options for obtaining stock methadone may be used to obtain stock buprenorphine. If a local pharmacy is partnering with the jail, arrangements and an initial stock order should take place *before* a case presents. Safeguarding, administration, and documents requirements are the same as for methadone.
